

Galilean Nights Event ID: gn294

Number of telescopes: 1

Number of organisers: 1

Number of attendees: 50

Event Report:

The event focused on showing people the surface of the moon using the telescope and we used sterrallium software to get more insight of the solar system family and having closer look of Jupiter's four Moon.

There were a lot of question on how envestigion of extraterreestrial life, what is the universe, galaxy, is it possible to see a planet with naked eyes, how far is are the stars from the Earth.

The event opened people's eyes and it inspired a lot of young people to have curiocity on what surrounds them. The major question asked by these young people was what subjects they should take in order to understand much about science and I encouraged them to take phyisics and Mathematics without exception to other science subjects to finally make their dream come true.

I had a lucky to be visited by one Person who came from very far after reading about the event in the news paper and he was very glady to gain the new knowledge in his life. I would real like to Thanks Mr. Raymond for his desire to learn new things.

One big challenge left with our generation today in developing, is that there is no future for scientistist especially young one and eventually lead to diversion of many young esteemed scientist. I encouraged these young people that "a scientist is the child of the world" and "human knowledge belongs to the world" I would like all of us to make these words come to for Young African scientists to rise and shine.
